

## **NexGen Enterprises – ver. 1.0**

### **Background**

This new concept emerged while trying to address the current state-of-the-art enterprise's demerits, limitations and biased structures and ideology that cater to the narrow goals of the selected few owing the enterprise. To address various issues, drawbacks and evils of the current prevailing corporate practices, many enterprises do not qualify or meet the emerging best practices and governance that tag such enterprises as fictitious and dubious that are highly human dependent and raise large debts to maintain and sustain such large labor force that are highly unpredictable, lack basic morale or ethics and can be highly biased when money, authority and power based decisions are made, especially at the lower levels can affect the productivity and can deviate from the real mission.

This puts lot of burden to the board, governance and national financial systems that have to mint more money and borrow to keep the system operational. Various national importance projects have to be kept operational even if they are highly corrupt and biased. One example can be the IT systems that need continuous monitoring, patching and operational to meet the near real time needs of the resident basic needs. However humans are not reliable at all levels and history is the best proof. We can question the enterprises that call engineering research; in real fact finding exercise you will not find a large team of licensed engineers. Many a times various non-merit attributes play a role during hiring, firing, promoting staff. All these lead to lost opportunities, wrong investments, hired based on promises and not real proof of work or license etc. So these stereotyped enterprises make a large portion of the economy and all of them practice almost same type of copy paste policies.

Moreover the enterprises know that their demands are easily met by the Govt when they propose newer and innovative methods. Real licensed staff are kept away or never hired as they know they will revolt when they find the evil practices at large inside the enterprise. Products, services are not developed by real licensed engineers but someone who has been placed that the enterprise and hirers deemed fit based on their origins, skin color, popularity, popular names, religion etc. These are newer checked by the owner as to why these were hired and someone with merit was not selected. Background checks never check the technical licenses which are mandatory however they skip this and quote that there is shortage of engineers and fill unprofessional non engineers to the engineering job. Moreover offshore companies play a different game plan. They are body shoppers for whom head count income is all they need, moreover they are highly biased and never offer the true talent to clients, they send their family, friends and unprofessional whom they are comfortable to deal and get at cheap. To move to a better enterprise we propose a newer concept of "NexGen Enterprise" that considers most of these evils and propose remedies that can benefit the mass.

With this type of background, I am sure you will appreciate a newer paradigm and way of living and working in a society that values ethics, truth, honesty and improve productivity with lesser disruptions due to human bias and purposeful damages caused due to personal selections of staff, products and services that never were promised to pay off good returns.

## Introduction to NexGen Enterprise (NGE)

1. NGE is less human dependent, bias free, highly agile, highly automated new age corporate and factory aligned.
2. NGE hosts governance framework at various levels like at factory level, municipality level, district, state and country level with almost uniform civil code and some local personalized to meet products not favor human and their bias and greed.
3. Solution cafe centers based on the NGE can replace many training centers, education and various domain related trainings and colleges units. These center offer newer logical, functional and automated software, tools and robots that allow fewer humans to supervise and offer offloading of highly laborious and repetitive tasks to service robots, be it a factory, enterprise, engineering plant , a medical center or a research lab
4. Govt is made up of members from all types of diverse origins. Govt is supported by Good governance run by QAI ASI driven Supercomputer that is based on the NGE platform and a fleet of robots and expert human supervisor that can assist in productivity and human interaction without introducing any bias, favoritism, or scandals during any enterprise transaction. This is called a true enterprise where many loopholes are being addressed
5. We provide transformational experience of the so called the present legacy fictitious companies, and the state-of-the art factories to NexGen Enterprises, removing the existing over dependency on highly non- predictable, highly biased humans that suck the company and invoke Govt to print more money thereby increasing debt. We design less human-dependent enterprises that can be used on a pay as u go model or provide a large one time CapEx investment. A team of various robots, data entry, office receptionist, coders, and automation all that meets your domain needs.
6. Robots are highly efficient, use latest QAI to remove bias and use lesser energy than state of art electronics by using quantum computing (a 100 qubit QPU can be highly complex but provide many fold energy savings and more capacity to churn large data in a short time)
7. Human with hi skills, clear background with no greed, liar types, biases, favorites all will be checked when operating these highly non biased system under strict monitoring and auditing standards. Only highly qualified and with proper ethical background and have track record of no bias, favoritism and so called no bad culture. Humans may be intelligent however if they have bad track record they may not qualify to operate such system that can jeopardize the supply chain, halt production and be a great threat to public safety.
8. There are many incidents that need a large book to depict and explain the long list of social and industrial evils. For example, using various leverages and authority many non-engineers occupy and enjoy various jobs as they are highly paid and respected. However, these staff does not understand the

complexities of the job and are posted because they have a big boss, an influencer or a popular feature that allows them to remain in the job.

In summary NGE offer a paradigm shift in Industrial development, renewed Govt platforms ( not only to offer promise but also fund real enterprises), educational systems (avoiding human bias based results), factories(reduction in industrial evils and group revolts based on personal greed and ends), engineering (highly automated and more productivity with lesser human errors and lesser dependency on skilled labor), social behaviors ( racism, bias, favoritism, pay fixations, promotions, personal goals etc), social and industrial evils (personal appointments, whole family earning large portion of returns, public money, labor taxes labeled as private family earnings), maximize human knowledge, harness for max products with min disruption and availability of merit and skills based staff globally( any time setup and operationalise robot factory and fleets). This will avoid the middle agencies and various private players who offer various pro-substitute services to the Govt and clients that may not be aware of what the middle men's real goals, business model or labor negotiations that happen in the background that many a times are against fair practices or illegal. Finally wrong placements, promotions and related human related so called diseases can be reduced and eliminated with our NGE.

I hope to hear from you. See you next time.
